3	Hams Awad Almalki	
4	Wejdan Alzahrani	

• The Contents:

No.	Contents	Pages.
1	Project Idea	2
2.1	The Problem	2
2.2	The Sloution	2
2.3	Why This Sloution?	3
3	The Goal	3
4	Design Process	3-5

1. Project Idea :

The concept behind this project is to establish a virtual menu and ordering solution, where potential patrons of restaurants can discover and choose from various food options, including their prices, and place orders directly via the internet.

---

2. Problem & Sloution

2.1 Problem:

There are a lot of customers that take forever to put in their food orders because they might be waiting for long periods of time. Also there is no online ordering system available which leads to issues in how orders are processed. Manually taking orders creates lots of stress and frustration for the customer, results in many inaccurate phone orders being taken by employees, and ends up resulting in a loss of sales during peak periods.

2.2 Sloution:

The entire point of doing this project is to create a simple to use web application so that customers can view a restaurant menu and easily order food off of that same menu. With a simple way to display meals with their prices, the ordering system will allow for quicker and easier ways for the customers to put in their order. This will lead to happier customers!

2.3 Why this solution?

We chose this solution because it helps a lot in solving the problem of restaurant orders, and it is very useful, simple at the same time, easy to implement and serves the purpose for which we will achieve this website.

---

3. Goal:

The primary objective is to facilitate the overall ordering experience for both patron and restaurant. In achieving this goal, the system will minimize the time required for customers to wait in line, create a well-defined and well-organized display of menu items, and provide an efficient mechanism for patrons to move from browsing the menu to placing an order and receiving confirmation of order.

---

4. Design Process:

We followed a simple and clear process of design for work on our website to order food, and these are the most prominent processes we followed:

1. Understand what the problem is?

We discussed the existence of the main problem, which was that both customers and employees sometimes find it difficult to order and fulfill food faster, especially during peak and busy times.

2. Choosing the most suitable solution:

Then we decided to solve this problem by creating a simple website that helps all users to review the restaurant menu and place orders quickly, as well as help the food service staff to prepare orders in an organized manner.

3. Selecting the main pages:

We have identified the main pages that should be on this site and serve to solve the problem, which were:

1- The main page that shows the restaurant interface and the option to go to the menu.
2- The menu page that puts all the food items available to order with the prices for each item.
3- The shopping cart page that shows the user's choice of food orders that they want to buy with the total quantity and price.
4- The payment page through which the purchase can be confirmed and the order process can be completed successfully.
5- The order confirmation page that shows the user that the order process has been completed.

4. Organizing user steps:

We have also thought about how the user can navigate the site for more than one page by putting an option in the easiest for all interfaces to navigate between pages, starting from the home page, through which you will go to browse the menu, then go to choose the items, add them to the shopping cart, end with the interface of placing the order and the success of the process.

5. Page Design:

We have all worked on the process of designing website pages using a simple and clear design to perform it and be easy to understand and use for all parties, through the (Canva) software.

6. Final Design Review:

After the designs are finalized, we thoroughly review all the pages together to make sure they are easy to use, clear and productive.

7. Work Planning:

Finally, we created a Gantt chart so that we can organize our tasks and make the distribution of work among team members clear to everyone.
